APPLICANT: Willingham, Mark
APPLICANT: Willingham, Ulrich
APPLICANT: Pai, Lee
TITLE OF INVENTION: Tumor-Specific Antibody Fragmente
CONFUTER: Two Embarcadero Center, Bighth Floor
STREET: Two Embarcadero
CONFUTER: IBM PC compatible
OPBRATING SYSTEM: PC-DSO/MS-DOS
SOFTWARE: Patentin Release #1.0, Version #1.30
CUMPUTER: 103-DEC-1996
SOFTWARE: Patentin Release #1.0, Version #1.30
SOFTWARE: Patentin NUMBER: US 08/331,398
FILING DATE: 20-CCT-1994
FILING DATE: 20-CCT-1994
FILING DATE: 10-CCT-1997
APPLICATION NUMBER: US 07/56,289
FILING DATE: 12-CCT-1997
APPLICATION NUMBER: US 07/596,289
FILING DATE: 12-CCT-1997
ATPORNEY/ARIA INFORMATION:
NAME: Weber, Ellen L.
SEQUENCE CHARACTERISTICS:
LENGTH: 119 amino acide

Sequence 80, Application US/09315926A

Patent No. 6498027

GENERAL INFORMATION:

APPLICANT: Be van, Helmuth

APPLICANT: Havenga, Menzo

APPLICANT: Verlinden, Stefan

TITLE OF INVENTION: TARGETED DELIVERY THROUGH A CATIONIC AMINO ACID TRANSPORTER

FILE REFERENCE: 2183-4080US

CURRENT APPLICATION NUMBER: US/09/315,926A

CURRENT FILING DATE: 1999-05-20

PRIOR APPLICATION NUMBER: EP 99201593.3

PRIOR APPLICATION NUMBER: EP 98201693.3

PRIOR FILING DATE: 1998-05-20

NUMBER OF SEQ ID NOS: 81
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          9

```
comprises at least a portion of an immunoglobulin molecule, especially chain and/or light chain variable regions given in the present sequence and in AAM51165, or either all of the CDRs of the heavy chain sequence and in AAM51165, or either all of the CDRs of the heavy chain (see AAM51158-60) or all of the CDRs of the light chain (see AAM51161-63). The antibody may inhibit TNF-induced cell adhesion molecules, inhibit TNF binding to receptor, or provide Arthritic Index improvement in a mouse model. It is useful for diagnosing or treating a TNF related condition in a cell, tissue, organ or animal (claimed) such as rheumatoid arthritis, gastric ulcer, asthma, allergic rhinitis, Crohn's pathology, sickle cell anaemia, diabetess, a cardiovascular disease such as a pathorosis, atherosclerosis, restenosis, angina pectoris or arteriosclerosis, atherosclerosis, restenosis, angina pectoris or viral, and fungal infections, pneumonia, leprosy and malaria, a malignant disease such as leukaemia, chronic myelocytic leukaemia, Burkitt's lymphoma and multiple myeloma, or a neurological disease such as multiple sclerosis, Parkinson's disease, spinal ataxia, Alzheimer's disease and creutzfeldt-Jakob disease, spinal ataxia, Alzheimer's disease and
                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                    9

portions or variants thereof. Specifically, it refers to an antibody
fragment where a protein has been inserted into, or replaces a portion
of, one or more CDR regions, such that each CDR mimetibody comprises at
least one portion of a heavy chain or light chain variable region, which
itself comprises at least one human framework region and at least one
itself comprises at least one human framework region and at least one
itself comprises at least one human framework region and at least one
itself comprises at least one human framework region and at least one
itself comprises at least one human framework region and the least one
itself comprises to the CDR mimetibody is useful for
that can be useful in gene therapy and the generation of transgenic
plants and animals. Furthermore, the CDR mimetibody is useful for
preparing compositions for modulating, treating or reducing the symptoms
of immune, cardiovascular, infectious, malignant and/ or neurologic
diseases, as well as anaemia. Accordingly, they exhibit immunomodulator,
cardiant, antimicrobial, cytostatic and neuroprotective activities. This
polypeptide segmence is an errethroniating to the control of the cardiant.

gion, chain re variable region comprising a portion of a heavy or light c variable region comprising human framework or ligand binding useful for preparing a composition for treating e.g., immune, cardiovascular or neurologic disease

2; SEQ ID NO 996; 97pp; English. Example

cibody portion prises at cific portions or variants thereof. Specifically, it refers to an ant fragment where a protein has been inserted into, or replaces a of, one or more CDR regions, such that each CDR mimetibody comp novel mammalian CDR mimetibodies, relates to

```
ç,
itself comprises at least one human framework region and at least one ligand binding region (LBR). The present invention describes human mimetibodies, including modified immunoglobulins and cleavage products that can be useful in gene therapy and the generation of transgenic plants and animals. Furthermore, the CDR mimetibody is useful for preparing compositions for modulating, treating or reducing the symptoms of immune, cardiovascular, infectious, malignant and/or neurologic diseases, as well as anaemia. Accordingly, they exhibit immunomodulator, cardiant, antimicrobial, cytostatic and neuroprotective activities. This polypeptide sequence is an erythropoietin heavy chain mimetibody of the invention.

variable region comprising human framework or ligand binding region, useful for preparing a composition for treating e.g., immune, cardiovascular or neurologic disease. 

2; SEQ ID NO 991; 97pp; English. Example

portions or variants thereof. Specifically, it refers to an antibody fragment where a protein has been inserted into, or replaces a portion of, one or more CDR regions, such that each CDR mimetibody comprises at least one portion of a heavy chain or light chain variable region, which itself comprises at least one human framework region and at least one ligand binding region (LBR). The present invention describes human specific This invention relates to novel mammalian CDR mimetibodies,

                                                                                                                                                                                                                                                                           120
           that can be useful in gene therapy and the generation of transgenic plants and animals. Furthermore, the CDR mimetibody is useful for preparing compositions for modulating, treating or reducing the symptoms of immune, cardiovascular, infectious, malignant and/ or neurologic diseases, as well as anaemia. Accordingly, they exhibit immunomodulator, cardiant, antimicrobial, cytostatic and neuroprotective activities. This polypeptide sequence is an erythropoietin heavy chain mimetibody of the
                                                                                                                                                                                                   9

                                                                                                                               leprotic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence is that of the heavy chain variable region of antitumour necrosis factor (TNF) human recombinant monoclonal antibody (mAb) TNV14. TNV14 was 1 of 8 human mAbs produced from a GenTNV fusion using spleen cells from a hybrid mouse containing human variable and constant region antibody transgenes that was immunised with human TNF alpha. The human mAbs bound immobilised human TNF alpha with high avidity and had totally human IgG1, kappa isotype. They showed relatedness to each other and to the human germline DP-46 heavy chain sequence (see AAMS1167). The

invention provides isolated human, primate, rodent, mammalian, chimeric, humanised and/or complementarity determining region (CDR)-grafted antiTWF antibodies, immunoglobulins, cleavage products and other specified portions and variants, as well as anti-TWF antibody compositions, encoding or complementary nucleic acids, vectors, host cells, compositions, formulations, devices, transgenic animals, transgenic plants, and methods of making and using them. The anti-TWF antibody comprises at least a portion of an immunoglobulin molecule, especially the heavy chain and/or light chain variable regions given in the present sequence and in AAMS1165, or either all of the CDRs of the heavy chain (see AAMS1165, or all of the CDRs of the light chain (see AAMS1161-CG and inhibit TWF binding to receptor, or provide Arthritic Index improvement in a mouse model. They are useful for diagnosing or treating a TWF related condition in a cell, tissue, organ or animal (claimed) such as trentated condition in a cell, tissue, organ or animal (claimed) such as pathology, sickle cell anaemia, diabetes, a cardiovascular disease such as arteriosclerosis, atherosclerosis, acsthma, allergic rhinitis, Crohn's pathology, sickle cell anaemia, diabetes, a cardiovascular disease such as leukaemia, chronic myelocytic leukaemia, a malignant disease such as leukaemia, chronic myelocytic leukaemia, and multiple myeloma, or a neurological disease such as multiple myeloma, or a neurological disease and sa fulliple sylenaese, spinal ataxia, Alzheimer's disease and creutzfeldt-Jakob disease, spinal ataxia, Alzheimer's disease and 9 79 Tumour necrosis factor alpha; TNF; antibody; heavy chain; CDR; complementarity determining region; antirheumatic; antiarthritic; antiulcer; antiasthmatic; antiallergic; antiinflammatory; antisickling; antidiabetic; antiarteriosclerotic; antiatherosclerotic; vasotropic; antianginal; cardiant; antibacterial; virucide; fungicide; antileprotic; protozoacide; cytostatic; neuroprotective; antiparkinsonian; nootropic; human; diagnosis; therapy; TNV148; monoclonal antibody; mAb. and may QVQLVESGGGVVQPGRSLRLSCAASGFTFSSYAMHWVRQAPGKGLEWVAVISYDGSNKYY 115 ADSVKGRFTISRDNSKNTLYLOMNSLRAEDTAVYYCARDRGISAGGN-YYYYGMDV Location/Qualifiers

The present sequence is that of the heavy chain variable region of antitumour necrosis factor (TNF) human recombinant monoclonal antibody (mAb) TNV148(B). TNV148(B) was produced by site-directed mutagenesis of TNV148 (see AAM51170), replacing residue Pro-94 with a germline Ser TNV148 was 1 of 8 human mAbs produced from a GenTNV fusion using spleen cells from a hybrid mouse containing human variable and constant region antibody transgenes that was immunised with human TNF alpha. The human mAbs bound immobilised human TNF alpha with high avidity and had a totally human 10g1, kappa isotype. They showed relatedness to each other and to the human mean indicated human, primate, rodent, mammalian, chimeric, humanised and/or complementarity determining region (CDR)-grafted anti-TNF antibodies, immunoglobulins, cleavage produces and other specified portions and variants, as well as anti-TNF antibody compositions, formulations, devices, transgenic animals, transgenic splants, and methods of making and using them. The anti-TNF antibody compositions, formulations of making and using the capions given in the present sequence and in AAM51165, or either all of the CDRs of the heavy chain (see AAM51186-60) or all of the CDRs of the light chain (see AAM51161-61). The antibodies may inhibit TNF-induced cell adhesion molecules, inhibit TNF phinding to receptor, or provide Arthritic Index improvement in a mouse model. They are useful for diagnosing or treating a TNF related condition in a cell, tissue, organ or animal (claimed) such as pathology, sickle cell annemia, diabetes, a cardiovascular disease such as arteriosclerosis, atherosclerosis, restenosis, and main an all ideations and an animal claimes of the my proverse in a cell such as bacteriosclerosis, and minecious disease in a cell such as arteriosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     as multiple

Compositions, formulations, devices, transgenic animals, transgenic plants, and methods of making and using them. The anti-TNF antibody compositions, formulations, devices, transgenic animals, transgenic plants, and methods of making and using them. The antibody chain and/or light chain variable regions given in the present sequence and in AAM51165, or either all of the CDRs of the heavy chain (see AAM51161-63). The antibodies may inhibit TNF-induced cell adhesion molecules, inhibit TNF binding to receptor, or provide Arthritic Index improvement in a mouse model. They are useful for diagnosing or treating a TNF related condition in a cell, tissue, organ or animal (claimed) such as rheumatoid arthritis, gastric ulcer, asthma, allergic rhinitis, Crohn's pathology, sickle cell anaemia, diabetes, a cardiovascular disease such as arteriosclerosis, atherosclerosis, restenosis, angina pectoris or myocardial infarction, an infectious disease in a cell such as bacterial, viral, and fungal infections, pneumonia, leprosy and malaria, a malignant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          bacterial,
a malignant
                                                                                                                                                                                                                                         The present sequence is that of the heavy chain variable region of antitumour necrosis factor (TNF) human recombinant monoclonal antibody (mAb) TNV148 was 1 of 8 human mAbs produced from a GenTNV fusion using spleen cells from a hybrid mouse containing human variable and constant region antibody transgenes that was immunised with human TNF alpha. The human mAbs bound immobilised human TNF alpha with high avidity and had a totally human IgG1, kappa isotype. They showed relatedness to each other and to the human germline DP-46 heavy chain sequence (see AAM51167). The invention provides isolated human, primate, rodent, mammalian, chimeric, humanised and/or complementarity determining region (CDR)-grafted anti-TNF antibodies, immunoglobulins, cleavage products and other specified portions and variants, as well as anti-TNF antibody compositions, formulation or complementary nucleic acids, vectors, host cells,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          disease such as leukaemia, chronic myelocytic leukaemia, Burkit lymphoma and multiple myeloma, or a neurological disease such a sclerosis, Parkinson's disease, spinal ataxia, Alzheimer's dise Creutzfeldt-Jakob disease. The present sequence is that of the heavy chain variable region of antitumour necrosis factor (TNF) human recombinant monoclonal antibody (mAb) (TUM196. TNV196 was 1 of 8 human mAbs produced from a GenTNV fusion using spleen cells from a hybrid mouse containing human variable and constant region antibody transgenes that was immunised with human TNF alpha. The numan mAbs bound immobilised human TNF alpha with high avidity and had a cotally human 1gG1, kappa isotype. They showed relatedness to each other and to the human germline DP-46 heavy chain sequence (see AAM51167). The invention provides isolated human, primate, rodent, mammalian, chimeric, humanised and/or complementarity determining region (CDR)-grafted antiportions and variants, as well as anti-TNF antibody compositions, formulations, devices, transgenic animals, transgenic plants, and methods of making and using them. The anti-TNF antibody compositions, formulations, devices, transgenic animals, transgenic plants, and methods of making and using them. The anti-TNF antibody compositions, devices, transgenic animals, transgenic comprises at least a portion of an immunoglobulin molecule, especially the heavy chain and/or light chain variable regions given in the present sequence and in AAM51165, or either all of the CDRs of the heavy chain (see AAM51158-60) or all of the CDRs of the light chain (see AAM51161-63). The antibodies may inhibit TNF-induced cell adhesion molecules, inhibit TNF binding to receptor, or provide Arthritic Index improvement

domain disorder (HA New protein comprising an immunoglobulin heavy chain variable and an immunoglobulin light chain variable (VL) domain, useful preparing a composition for treating or preventing a cancerous

English. 224pp; Fig 19B; Disclosure; The present invention describes a protein comprising an immunoglobulin (Ig) heavy chain variable (VH) domain and an Ig light chain variable (VL) domain. The protein binds a complex comprising a major histocompatibility complex (MHC) and a peptide, does not substantially bind the MHC in the absence of the bound peptide, and does not substantially bind the peptide in the absence of the MHC. The peptide is a peptide fragment of gpl00,

Comprising the novel protein and a carrier; (2) a cytotoxic T cell comprising the novel protein and a carrier; (2) a cytotoxic T cell comprising one or more nucleic acids for expressing the Ig that binds a comprising one or more nucleic acids for expressing the Ig that binds a complex having an MHC and a peptide, does not substantially bind the MHC in the absence of the MHC; (3) an isolated nucleic acid comprising a first segment that encodes the Ig variable domain; (4) a comprising heterologous nucleic acid sequences that encodes the rovel protein; (5) a transgenic animal whose genome includes heterologous nucleic acid sequences that encode the protein; (6) identifying the protein that specifically binds the MHC-peptide complex; (7) expressing an antigen-binding protein; (8) ablating or killing a target cell that displays a peptide on a surface MHC molecule; (9) treating or preventing a cancerous disorder in a subject; and (10) detecting an MHC-peptide complex in a sample. A protein of the invention has cytostatic activity, and can be used in gene therapy. The protein is useful for preparing a composition for treating or preventing a cancerous disorder. The present sequence represents the heavy chain of an antibody which binds to an MHC-peptide complex where the peptide component in as peptide fragment of
                                                                                                                                                                                                                                                                                                                                                                                                    ij
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     domains retaining

or multivalent polypeptide. The method comprises (a) testing a panel of BSD displayed on the surface of a biological display system as part of a biological displaye, where the fusion protein for binding to a predetermined epitope, where the fusion protein comprises an additional domain positioned N-terminal of the BSD and an amino acid sequence that mediates anchoring of the fusion protein to the surface of the display system; and (b) identifying a BSD that comprise to the predetermined epitope. The method is useful to identify bior or multivalent polypeptides that comprise antibody binding sites capable of efficiently binding to the corresponding antigen. The polypeptides or antibodies identified by the method are useful therapeutically and cancer and autoimmune diseases. ScFv-antibody fragments that bind independently of their position within bifunctional single-chain fusion proteins can be isolated from combinatorial antibody contains the new in vitro method

Production of anti-human antigen receptors - by selecting a combination of functionally rearranged VH and VL immunoglobulin chains expressed fra recombinant vector.

7; 84pp; English. Fig ٠<u>.</u> Claim

This is the amino acid sequence of the human D4.5 heavy chain variable region, used in the method of the invention. for providing receptors that can be used for targeting antigens in humans without being immunogenic themselves. Such receptors can be used for treating diseases such as

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention describes novel antibodies that immunospecifically bind to B Lymphocyte Stimulator (BLyS) polypeptides. BLyS is a member of the tumour necrosis factor (TNF) super family and induces B cell proliferation and differentiation. The antibodies of the invention have cytostatic, immunosuppressive, immunostimulant, immunomodulatory, antirheumatic and antiAIDS activity and can be used in vaccines to inhibit the expression and activity of BLyS. The antibodies bind to BLyS and so may be used to detect and quantitate the presence of BLyS in biological samples and may be used in this way to diagnose disease associated with aberrant expression of BLyS. They may also be
tumours or auto-immune diseases, graft rejection after transplantation, infectious diseases by targeting cellular receptors as well as allergic, inflammatory, endocrine and degenerative diseases by targeting key molecules involved in the pathological process

This invention relates to novel antibodies that immunospecifically bind to B lymphocyte stimulator (BLyS). The BLyS gene has been mapped to chromosome 13q34 and encodes a protein that is a member of the tumour necrosis factor superfamily and induces both in vivo and in vitro B cell proliferation and differentiation. Specifically, it refers to single chain antibody molecules (scFvs) derived, preferably, from the variable heavy CDR3 region that immunospecifically bind to a polypeptide, or fragment thereof, of either human, murine, rat or monkey BLyS. The present invention refers to the use of such antibodies in various methods for the detection, diagnosis and prognosis of diseases related to the aberrant expression or inappropriate function of BLyS or its receptor. The patent discloses heterominibodies which are multifunctional compounds produceable in a mammalian host cell as a secretable and fully functional heterodimer of two polypeptide chains, where one of the polypeptide chains comprises, a CH1-domain (constant domain of an immunoglobulin heavy chain) and the other chain comprises CL-domain (constant domain of an immunoglobulin light chain). The polypeptide chains further comprise,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   cell

                                                                                                                                                                                                                                                                                                                                                                               9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     nosi
                                                                                                                                                                                                                                                                                                               QVQLVESGGGVVQPGRSLRLSCAASGFTFSSYAMHWVRQAPGKGLEWVAVISYDGSNKYY
                                                                                                                                                                                                                                                                                                                                  including myasthenia gravis and multiple sclerosis, inflammatory disorders e.g. asthma and rheumatoid arthritis, infectious diseases as AIDS and proliferative disorders including leukaemia, carcinoma an lymphoma. Accordingly, they can be described as exhibiting various activities such as antirheumatic, antiarthritic, neuroprotective, antiinflammatory, antiasthmatic, antiallergic and cytostatic. This polypeptide sequence is a single chain antibody that binds BLyS of thinvention. NOTE: The sequence data for this patent did not form part the printed specification, but was obtained in electronic format directely from WIPO at ftp.wipo.int/pub/published pct_sequences.

fused to the constant domains at least two (poly)peptides having

different receptor or ligand functions, where further at least two of the

different (poly)peptides lack an intrinsic affinity for one another and

are linked via the constant domains. The heterominibodies have

cytostatic, immunostimulatory, antileukaemia and antiproliferative

activities. These compounds can be used for diagnosing, preventing and

creating malignant cell growth related to malignancies of haematopoietic

cells e.g. lymphomas and leukaemias, or to solid tumours e.g. carcinomas,

melanomas and sarcomas. The present sequence is the left chain of a

heterominibody comprising HD70 single-chain Fv (scFv) fragment N-

terminally linked to human CH1 domain which bears at its C-terminus the

human inflammatory cytokine granulocyte/macrophage colony stimulating

factor (GM-CSF), plus a hexahistidine sequence for ease of purification.

HD70 scFv specifically recognises the human epithelial cell adhesion

molecule (EpCAM) also called 17-1A antigen

heterodimer of two polypeptide chains, where one of the polypeptide chains comprises, a CH1-domain (constant domain of an immunoglobulin heavy chain) and the other chain comprises CL-domain (constant domain of an immunoglobulin light chain). The polypeptide chains further comprise, fused to the constant domains at least two (poly)peptides having different receptor or ligand functions, where further at least two of the different (poly) peptides lack an intrinsic affinity for one another and are linked via the constant domains. The heterominibodies have cytostatic, immunostimulatory, antileukaemia and antiproliferative activities. These compounds can be used for diagnosing, preventing and treating malignant cell growth related to malignancies of haematopoietic cells e.g. lymphomas and leukaemias, or to solid tumours e.g. carcinomas, melanomas and sarcomas. The present sequence is the right chain of a melanomas and sarcomas. The present sequence is the right chain of a melanomas and sarcomas. The present sequence is the right chain of a terminally linked to human Ck domain (constant domain of immunoglobulin-kappa light chain) which bears at its C-terminus the human inflammatory cytokine interleukin-2 (IL-2). HD70 scFv specifically recognises the human epithelial cell adhesion molecule (EpCAM) also called 17-1A antigen

from the
useful for modulating collagen formation, and for staging various cancers. Antibodies to platelet-derived growth factor-D (PDGF-D) were generated using an active protein fragment of the gene product from the clone 30664188.0.99 arising in the conditioned medium obtained when HEK293 cells are transfected with the plasmid pCEP4/Sec-30664188. This sequence corresponds to a protein used in the invention.

growth human human monoclonal antibody that binds to platelet-derived tor-D (PDGF-D), useful for treating chronic and recurrent eases, such as inflammation, autoimmunity and cancer. diseases, actor-D New

209; 255pp; English Disclosure; SEQ ID NO The invention relates to a human monoclonal antibody that binds to platelet-derived growth factor-D (PDGF-D). The antibodies are useful for treating chronic and recurrent human diseases, such as inflammation, autoimmunity and cancer. The PDGF-D nucleic acids and polypeptides are useful for modulating collagen formation, and for staging various cancers. Antibodies to platelet-derived growth factor-D (PDGF-D) were generated using an active protein fragment of the gene product from the clone 30664188.0.99 arising in the conditioned medium obtained when HEK293 cells are transfected with the plasmid pCEP4/Sec-30664188. This sequence corresponds to a protein used in the invention.

The present invention describes an antibody or its binding fragment that binds platelet derived growth factor-DD (PDGF-DD), where the antibody is useful in preparing a medicament for treating nephritis. Also described:
(1) a method of detecting nephritis; (2) a method of treating nephritis; (3) a method of inhibiting mesangial cell proliferation; and (4) a method of treating mesangial proliferative glomerulonephritis. The antibody has nephrotropic, antiinflammatory, dermatological, immunosuppressive and antidiabetic activities, and can be used in gene therapy. The antibody or its binding fragment, that binds PDGF-DD, can be used in preparing a medicament for treating nephritis and related disorders, e.g., mesangial proliferative glomerulonephritis. The present sequence represents a human monoclonal antibody (mAb) variable region sequence, which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ADSVKGRFTISRDNSKNTLYLOMNSLRAEDTAVYYCARDRGISAGGNYYYYGMDV

New recombinant human monoclonal antibody that specifically binds to Tumor Necrosis Factor-alpha, useful for treating neoplastic disease such as cancers, or immuno-mediated inflammatory diseases such as rheumatoid arthritis.

Example 10; SEQ ID NO 128; 213pp; English

The present invention describes a human monoclonal antibody (I) that specifically binds to tumour necrosis factor-alpha (TNPa) and comprises:

(a) a heavy chain complementarity determining region I (CDRI) having the two fully defined 5 amino acid sequence (S1, ADP22417) or (S2, ADP22421);

and (b) a light chain CDRI having the two fully defined 11 amino acid sequence (S3, ADP22418) or (S4, ADP22424). ADP22417) or (S2, ADP22418) or (S4, ADP22424). ADP22418 or (S4, ADP22424). ADP22418 or (S4, ADP22424). ADP22418 or (S4, ADP22424). ADP22418 or (S4, ADP22424). ADP2418 or (S4, ADP2244). ADP2418 o

the sample; (2) a composition comprising the antibody or its functional fragment and a carrier; (3) treating (M2) an animal suffering from a neoplastic, or an immuno-mediated inflammatory disease by selecting an animal in need of treatment for the disease by administering the human concolonal antibody of (I); and (4) inhibiting (M3) TWFa induced apoptosis in an animal by selecting an animal in need of treatment for TWFa induced apoptosis by administering the human monoclonal antibody of (I). (I) has anabolic, antiarteriosclerotic, antiarthritic, antibacterial, antiinflammatory, antippositic, antiarthritic, antibacterial, antiminflammatory, immunosuppressive, nephrotropic, cating-disorders, immunomodulator, immunosuppressive, nephrotropic, and can be used as a TWFa antagonist. The antibody (I) is useful in the preparation of medicament for treating TWF induced apoptosis, neoplastic disease such as breast cancer, ovarian cancer, blander cancer, lung cancer, glioblastoma, stomach cancer, and prostrate cancer; or immuno-mediated inflammatory diseases such as rheumatoid arthritis, glomerulonephritis, atherosclerosis, psoriasis, restences, canchersia, and antiple sclerosis. The present sequence represents a human anti-TNFa antibody heavy chain variable region, which is used in the exemplification of the present invention.

N-PSDB; ADP22315

eumatoid ease wew recombinant human monoclonal antibody that specifically binds Tumor Necrosis Factor-alpha, useful for treating neoplastic diseas as cancers, or immuno-mediated inflammatory diseases such as rheum arthritis.

Example 10; SEQ ID NO 222; 213pp; English.

The present invention describes a human monoclonal antibody (1) that specifically binds to tumour necrosis factor-alpha (TNFa) and comprises:

(a) a heavy chain complementarity determining region 1 (CDF1) having the two fully defined 5 amino acid sequence (51, ADP22417) or (52, ADP22421); and (b) a light chain CDR1 having the two fully defined 11 amino acid sequence (51, ADP22418) or (54, ADP22444). ADP3 described: (1) assaying (M1) the level of TNFa in a patient sample, comprising contacting with (I), and detecting the level of binding between the antibody and TNFa in the sample; (2) a composition comprising the antibody or its functional reagment and a carrier; (3) treating (M2) an animal suffering from a neoplastic, or an immuno-mediated inflammatory disease by selecting an onoclonal antibody of (I); and (4) inhibiting (M3) TNFa induced apoptosis in an animal by selecting an animal in need of treatment for the disease by administering the human monoclonal antibody of (I); and (4) inhibiting (M3) TNFa induced apoptosis by administering the human monoclonal antibody of (I); and (4) inhibiting (M3) TNFa induced apoptosis by administering the human monoclonal antibody of (I); and (I) inhibiting (M3) TNFa induced apoptosis by administering the human monoclonal antibody of (I); and (I) inhibiting (M3) TNFa induced apoptosis by administering the human monoclonal antibody of (I); and (I) inhibiting (M3) TNFa induced apoptosis by administering the human monoclonal antibody of (I); and (I) inhibiting (M3) TNFa induced apoptosis, antipody of (I); and (I) inhibiting (I) in the preparation of the present sequence; or immunoclonal antipody arthritis; and cancer, ovarian cancer, blanky which is used in the antibody, heavy chain variable region, which is used in the expression of the present invention.

Buch New recombinant human monoclonal antibody that specifically binds to Tumor Necrosis Factor-alpha, useful for treating neoplastic disease sucl as cancers, or immuno-mediated inflammatory diseases such as rheumatoid

213pp; English 218; Example 10; SEQ ID NO

The present invention describes a human monoclonal antibody (I) that specifically binds to tumour necrosis factor-alpha (TNFa) and comprises:

(a) a heavy chain complementarity determining region I (CDRI) having the two fully defined 5 amino acid sequence (31, ADP2241); and (b) a light chain CDRI having the two fully defined 11 amino acid sequence (31, ADP2241); and detecting the level of TNFa in a patient sample, comprising contacting with (II), and detecting the level of TNFa in a patient sample, comprising contacting with the sample; (2) a composition comprising the antibody and TNFa in need of treatment for the disease by administering from a neoplastic, or an immuno-mediated inflammatory disease by selecting an animal in need of treatment for the disease by administering the human monoclonal antibody of (II), and (4) inhibiting (M3) in need of treatment for TNFa induced apoptosis by administering the human monoclonal antibody of (II) and (4) inhibiting (M3) in need of treatment for TNFa induced apoptosis by administering the human monoclonal antibody of (II) and (4) inhibiting (M3) and the present for TNFa induced apoptosis by administering the human monoclonal antibody of (II) and (II) is useful in the preparation of antibacterial, antinflammatory, antipsoriatic, antirheumatic, eating-disorders, immunomodulator, immunosuppressive, nephrotropic, or artial cancer, ovarian cancer, bladder cancer, lung cancer, globlastoma, breast cancer, ovarian cancer, bladder cancer, lung cancer, globlastoma, streament cancer, bladder cancer, lung cancer, gancratic cancer, pancratic cancer, pancratic cancer, and prostrate cancer; or immuno-mediated inflammatory diseases such as rheumatoid arthritis, glomerulonephritis, atherosclevosis, psoriasis, restenosis, auccimmune disease, crown and antipple sclerosis. The present sequence represents a human anti-TNFa multiple sclerosis. The present sequence represents a human anti-TNFa multiple sclerosis. The present sequence represents a human anti-TNFa multiple sclerosis. used heavy chain variable region, whi ication of the present invention.

cobtained that bound immobilised human TNF alpha with apparently high avidity. These mabs had a totally human IgG1, kappa isotype. Their heavy chain variable region deduced amino acid sequences (see AAMS1168-72) chain variable region deduced amino acid sequences (see AAMS1168-72) showed high similarity to the DP-46 sequence. The invention provides isolated human, primate, rodent, mammalian, chimeric, humanised and/or complementarity determining region (CDR) grafted anti-TNF antibodies, and cleavage products and variants, as well as anti-TNF antibody compositions, encoding or complementary nucleic acids, vectors, host cells, compositions, formulations, devices, transgenic animals, transgenic plants, and methods of making and using them. The anti-TNF antibody comprises at least a portion of an immunoglobulin molecule, especially the heavy chain and/or light chain variable regions given in the present sequence and in AAM51165, or either all of the CDRs of the intervent sequence and in AAM51165, or either all of the CDRs of the light chain (see AAM51161-63). The antibodies may inhibit TNF-induced cell adhesion molecules, inhibit TNF binding to receptor, or provide Arthritic Index improvement in a mouse model. They are useful for diagnosing or treating a TNF related condition in a cell, tissue, organ or animal (claimed) such as rheumatoid arthritis, gastric ulcer, asthma, allergic rhinitis, cronic animal (claimed) such as bacterial, viral, and fungal infectious disease in a cell such as bacterial, viral, and fungal infectious pneumonia, leprosy and malaria, a malignant disease such as leukaemia, chronic myelocytical disease such as multiple myeloma, or a neurological disease such as multiple sclerosis, Parkinson's disease, spinal ataxia,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ij

US-09-456-090A-36

Sequence 36, Application US/09456090A

Patent No. 6680209

GENERAL INFORMATION:
APPLICANT: Buechler, Joe
APPLICANT: Valkirs, Gunars
APPLICANT: Cray, Jeff
APPLICANT: Lonberg, Nils
TITLE OF INVENTION: HUMAN ANTIBODIES AS DIAGNOSTIC REAGENTS
FILE REFERENCE: 020015-000200US
CURRENT APPLICATION NUMBER: US/09/456,090A

CURRENT FILING DATE: 1999-12-06

NUMBER OF SEQ ID NOS: 110

SOFTWARE: PatentIn Ver. 2.1
                                                                 Length
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Indels

The present sequence is that of the light chain variable region or an anti-tumour necrosis factor (TNF) antibody of the invention. The invention provides isolated human, primate, rodent, mammalian, chimeric, humanised and/or complementarity determining region (CDR)-grafted anti-TNF antibodies, immunoglobulins, cleavage products and other specified portions and variants, as well as anti-TNF antibody compositions, encoding or complementary nucleic acids, vectors, host cells, encoding or complementary nucleic acids, transgenic animals, transgenic
                                                                                                                                                                                    Tumour necrosis factor alpha; TNF; antibody; light chain; CDR; complementarity determining region; antirheumatic; antiarthritic; antiulcer; antiasthmatic; antiallergic; antiinflammatory; antisickling; antidiabetic; antiarteriosclerotic; antiatherosclerotic; vasotropic; antianginal; cardiant; antibacterial; virucide; fungicide; antileprotic; protozoacide; cytostatic; neuroprotective; antiparkinsonian; nootropic; human; diagnosis; therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             for

Derformed using spleen cells from a hybrid mouse containing human variable and constant region antibody transgenes that was immunised with recombinant human recrosis factor (TFF) alpha. Human mabs were compliant human tumour necrosis factor (TFF) alpha. Human mabs were betained that bound immobilised human TFF alpha. Human mabs were botained that bound immobilised human TFF alpha. Human mabs were portion of the light chain variable region of 2 of the mabs, TNV14 and TNV15, were identical (see AAM51174) to the present sequence, while the light chain variable region of 2 others, TNV148(B) and TNV196 (see AAM51175), differed by a single amino acid residue. The invention of provides human, primate, rodent, mammalian, chimeric, humanised and/or complementarity determining region (CDR)-grafted anti-TNF antibody compositions, encoding or complementary nucleic acids, vectors, antibody compositions, formulations, devices, transgenic animals, as well as anti-TNF antibody compositions, and methods of making and using them. The anti-TNF carbody compositions, and methods of making and using them. The anti-TNF antibody compositions formulations, devices, transgenic animals, and methods of making and using them. The anti-TNF antibody compositions and encoding or complementary nucleic acids, vectors, transgenic plants, and methods of making and using them. TNF antibodies at least a portion of an immunoglobulin molecule, especially the heavy chain and/or light chain variable regions given in the present sequence and in AAM51165, or either all of the CDRs of the heavy chain (see AAM51165.0). The antibodies may inhibit TNF-induced cell adhesion (see Molecules, inhibit TNF binding to receptor, or provide Arthritic Index improvement in a mouse model. They are useful for diagnosing or reeating a TNF related condition in a cell, tissue, organ or animal (crown's pathology, sickle cell anemia, diabetes, a cardiovascular disease such as arteriosclerosis, athercosclerosis, restenosis, animal and fungal infections, pneumonia, leptosy and ö nt chain variable mouse used in .body, useful restenosis, Gaps ö Length 108;

Human; antibody; dual integrin; HC CDR; variable region; LC CDR; medical device; immune related disease; rheumatoid arthritis; gastric ulcer; asthma; allergic rhinitis; Crohn's pathology; sickle cell anaemia; diabetes; cardiovascular disease; arteriosclerosis; atherosclerosis; restenosis; angina pectoris; myocardial infarction; infectious disease; pneumonia; leprosy; malaria; malignant disease; leukaemia; chronic myelocytic leukaemia; multiple myeloma; neurological disease; multiple sclerosis; Parkinson's disease; Alzheimer's disease; Creutzfeldt-Jakob disease. Novel isolated mammalian anti-dual integrin antibody, useful for diagnosing or treating dual integrin related condition such as rathritis, gastric ulcer, asthma, atherosclerosis, restenosis. Human anti-dual integrin antibody 07-AUG-2000; 2000US-0223363P 01-AUG-2001; 2001US-00920267 07-AUG-2001; 2001WO-US024784 standard; peptide; (CENZ ) CENTOCOR INC WPI; 2002-217193/27 WO200212501-A2. Giles-Komar J, Homo sapiens. 21-MAY-2002 14-FEB-2002 AAU76334; Claim 1; AAU76334

The invention relates to an isolated mammalian anti-dual integrin ...

antibody having at least one of the human heavy chain or light chain ...

complementary determining region (CDR, HC CDR1-CDR3, LC CDR1-3). Also included are the nucleic acids encoding the Vector, an anti-idiotype controlled are the nucleic acids encoding the Vector, an anti-idiotype controlled to the anti-dual integrin, a medical device comprising the antibody that binds to the anti-dial intracensistic intracensistic intracensistic intracensistic intracensistic intracelebellar, intracespular, intracerticular, intracerticular, intracerticular, intracelebellar, or other routes as given in specification. The antibody is useful for diagnosing or treating a dual integrin related condition in an animal for example, immune related disease such as rheumatoid arthritis, gastric ulcer, asthma, allergic rhinitis, Crohn's pathology, arthritis, and fungal infectious disease in a cell such as bacterial, viral, and fungal infectious disease in a cell such as bacterial, viral, and fungal infections, pneumonia, leprosy, malaria, maliphe myeloma, neurological disease such as multiple creations, preumonia, leprosy, malaria, malaphe myeloma, neurological disease such as multiple myeloma, neurological diseases such as leukaemia, charcological diseases such as multiple myeloma, neurological en an anti-dual integrin human sectoria, neurological proposition delication in the sectorial and many other diseases specification. The present sequence is an anti-dual integrin human variable region containing at least one of the six CDRs listed above (AAU76327-AAU76332) English Page 134; 144pp;

This invention relates to novel mammalian CDR mimetibodies, specific portions or variants thereof. Specifically, it refers to an antibody fragment where a protein has been inserted into, or replaces a portion of, one or more CDR regions, such that each CDR mimetibody comprises at least one portion of a heavy chain or light chain variable region, which itself comprises at least one human framework region and at least one ligand binding region (LBR). The present invention describes human mimetibodies, including modified immunoglobulins and cleavage products that can be useful in gene therapy and the generation of transgenic plants and animals. Furthermore, the CDR mimetibody is useful for preparing compositions for modulating, treating or reducing the symptoms of immune, cardiovascular, infectious, malignant and/or neurologic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        cand/ or neurologic exhibit immunomodulator, otective activities. This invention relates to novel mammalian CDR mimetibodies, specific portions or variants thereof. Specifically, it refers to an antibody fragment where a protein has been inserted into, or replaces a portion of, one or more CDR regions, such that each CDR mimetibody comprises at least one human framework region and at least one itself comprises at least one human framework region and at least one ligand binding region (LBR). The present invention describes human mimetibodies, including modified immunoglobulins and cleavage products that can be useful in gene therapy and the generation of transgenic plants and animals. Furthermore, the CDR mimetibody is useful for preparing compositions for modulating, treating or reducing the symptoms of immune, cardiovascular, infectious, malignant and/or neurologic diseases, as well as anaemia. Accordingly, they exhibit immunomodulator, cardiant, antimicrobial, cytostatic and neuroprotective activities. This polypeptide sequence is an erythropoietin light chain mimetibody of the
                                                                                                                                                                                                         mimetic; CDR mimetibody; gene therapy; transgenic; immune; cardiovascular; infectious; malignant; neurologic disease; anaemia; immunomodulator; cardiant; antimicrobial; cytostatic; neuroprotective; erythropoietin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            EIVLTQSPATLSLSPGERATLSCRASQSVSSYLAWYQQKPGQAPRLLIYDASNRATGIPA

esent sequence is that of the light chain variable region of antinecrosis factor (TNF) human recombinant monoclonal antibodies TNV14 and TNV15. These are human mAbs produced from a GenTNV using spleen cells from a hybrid mouse containing human variable nstant region antibody transgenes that was immunised with human TNF The human mAbs bind immobilised human TNF alpha with high avidity ve a totally human IgG1, kappa isotype. The mature portion of the chain variable region is identical to that of the Vg/38-type light

chain germline sequence (see AAM51173). The light chain variable regions of 2 other human mabs (see AAM51175) show a single amino acid difference. The invention provides human, primate, mammalian, rodent, chimeric, humanised and/or complementarity determining region (CDR)-grafted antiportions and variants, as well as anti-TNF antibody compositions, compositions, formulations, devices, transgenic animals, transgenic compositions, formulations, devices, transgenic animals, transgenic plants, and methods of making and using them. The anti-TNF antibody compositions, formulations, devices, transgenic animals, transgenic plants, and methods of making and using them. The anti-TNF antibody compositions, formulations, devices, transgenic animals, transgenic sequence and in AAM51165, or either all of the CDRs of the heavy chain (see AAM51158-60) or all of the CDRs of the light chain (see AAM51161-63). The antibodies may inhibit TNF-induced cell adhesion molecules, in a mouse model. They are useful for diagnosing or treating a TNF related condition in a cell, tissue, organ or animal (claimed) such as the pathology, sickle cell anaemia, diabetes, a cardiovascular disease such as atteriosclerosis, atherosclerosis, restenosis, angina pectoris or myccardial infaction, an infectious disease in a cell such as multiple will crantic myclocytic leukaemia, Burkitt's crantional and multiple myeloma, or a neurological disease and such as multiple seconds or a neurological disease and such as multiple seconds or a neurological disease and and multiple myeloma, or a neurological disease and and multiple myeloma, or a neurological disease and and multiple myeloma, or a neurological disease and

The present sequence is that on the institution variable sequence is that one trees is factor (TMP) human recombinant monoclonal antibodies (mabs) TNV148(B) and TNV196. These are human mabs produced from a GenTNV clusion using spleen cells from a hybrid mouse containing human variable and constant region antibody transgenes that was immunised with human TNF alpha. The human mabs bind immobilised human TNF alpha with high avidity and have a totally human igst, kappa isotype. The mature portion of the light chain variable region differs from that of the Vg/38-type light chain germline sequence (see AAMS1173) by a single residue (Tyr-50 teplacing Ser). The light chain variable regions of 2 other human mabs (see AAMS1174) were identical to the germline sequence. The invention provides isolated human, primate, rodent, mammalian, chimeric, humanised and/or complementarity determining region (CDR)-grafted anti-TNF antibodies, immunoglobulins, cleavage products and other specified portions and variants, as well as anti-TNF antibody compositions, formulations, devices, transgenic animals, transgenic plants, and methods of making and using them. The anti-TNF antibody compositions, compressed at least a portion of an immunoglobulin molecule, especially the heavy chain and/or light chain variable regions given in the present sequence and in AAMS1165, or either all of the CDRs of the heavy chain (see AAMS1158-60) or all of the CDRs of the light chain (see AAMS1161-63). The antibodies may inhibit TNF-induced call adhesion molecules in inhibit TNF binding to receptor, or provide Arthritic Index improvement in a mouse model. They are useful for diagnosing or treating a TNF related condition in a cell, tissue, organ or animal (claimed) such as theumatoid arthritis, gastric ulcer, asthma, allergic rhinitis, dastric ulcer, asthma, allergic rhinitis, correction an infertion a resterior animal collar animal and resterior animal collar animal and resterior animal collaring and resterior animal collar animal collar animal collar anim

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention provides the protein and coding sequences for human monoclonal antibodies which bind specifically to the HER2/neu growth factor receptor (also known as erbB2). These are designated 3-F2, 1-D2 and 2-E8. They can be used in the immunotherapy-based treatment and prognosis of cancers, particularly adenocarcinomas such as salivary gland, stomach, kidney, mammary gland, lung and squamous cell carcinomas, and ovarian cancer. The present sequence is part of an antibody of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            9

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes an isolated human antibody (I) that specifically binds osteoprotegerin ligand (OPGL). Also described: (1) a pharmaceutical composition comprising a pharmaceutical carrier and a the rapeutic amount of (I); (2) methods of treating an osteopenic disorder in a patient, comprising administering to a patient the pharmaceutical composition of (I) or a pharmaceutical amount of (I); and (3) a method for detecting OPGL in a biological sample, comprising contacting the sample with (I) under conditions that allow for binding of the antibody to opteopathic, and measuring the level of bound antibody in the sample. (I) has osteopathic, antiarthritic and cytostatic activities, and can be used in gene therapy. The composition and methods are useful in diagnosing or treating bone disorders, such as osteoporosis, bone loss from arthritis, baget's disease or osteopenia. The antibody (I) may also be used for detecting OPGL in biological samples and in identifying cells or tissues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

The present invention describes an isolated human antibody (I) that specifically binds osteoprotegerin ligand (OPGL). Also described: (1) a pharmaceutical composition comprising a pharmaceutical carrier and a therapeutic amount of (I); (2) methods of treating an osteopenic disorder in a patient, comprising administering to a patient the pharmaceutical composition of (I) or a pharmaceutical amount of (I); and (3) a method for detecting OPGL in a biological sample, comprising contacting the sample with (I) under conditions that allow for binding of the antibody in the sample. (I) has costeopathic, and measuring the level of bound antibody in the sample. (I) has osteopathic, antiarthritic and cytostatic activities, and can be used in treating bone disorders, such as osteoporosis, bone loss from arthritis, baget's disease or osteopenia. The antibody (I) may also be used for detecting OPGL in biological samples and in identifying cells or tissues that produce the protein. The present sequence represents a sequence the protein the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Anti-interleukin-1 receptor type 1 antibody kappa chain variable region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated antibody that specifically binds osteoprotegerin ligand, useful for diagnosing or treating bone disorders, such as osteoporosis bone loss from arthritis, Paget's disease or osteopenia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       EIVLTOSPATLSLSPGERATLSCRASOSVSSYLAWYQQKPGQAPRLLIYDASNRATGIPA

The present sequence is that of human anti-interleukin-1 receptor type 1 (IL-IR1) monoclonal antibody (MAb) 26F5 kappa chain variable region. Human MAbs to IL-IR1 were prepared using the HCO7 strain of transgenic wich purified recombinant IL-IR1, and splenocytes from immunised mice were fused to a mouse myeloma cell line to generate hybridomas. Hybridomas which secreted a MAb that bound with high avidity to IL-IR1 were gelected. The MAbs inhibit IL-1 signalling by competing with IL-1 beta and IL-lalpha binding to IL-IR. These MAbs, as well as single chain antibodies single chain Fv antibodies. Fab antibodies from them, are used in methods of treating and (Fab')2 antibodies decetting the amount of IL-IR1 in a sample. IL-1 mediated diseases include acute pancreatitis, amyotrophic lateral sclerosis, Alzheimer's disease, cachexia, anorexia, asthma, atherosclerosis, autoimmune vasculitis, chronic fatigue syndrome. Clostridium associated illnesses, coronary conditions, cancer including leukaemia and tumour metastasis, diabetes, endometriosis, fever, fibromyalgia, glomerulonephritis, graft versus host disease, cstematoid arthritis, inflammatory eye disease, ischaemia, Kawasaki's disease, learning impairment, lung disease, multiple sclerosis, multiple sclerosis, pain, parkinson's disease, multiple sclerosis, multiple sclerosis, pain, parkinson's disease, multiple sclerosis, pain, parkinson's disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      to IL-1R1 with IL-single chain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         antibodies

The present sequence is that of the light chain variable region of human anti-tumour necrosis factor (TNF) monoclonal antibody 9E7. This human TNF reactive IgG monoclonal antibody was generated by cloning variable and constant region DNA in vector pC4 and expression in CHO cells. The invention provides isolated human, primate, rodent, mammalian, chimeric, humanized and/or CDR-grafted anti-TNF antibodies, immunoglobulins, their cleavage products, other specified portions and variants, as well as anti-TNF antibody compositions, nucleic acids encoding these, vectors, host cells, methods for producing the antibodies using a host cell, transgenic animal or transgenic plant or plant cell, and therapeutic compositions, methods and devices. The antibody, nucleic acid, protein, composition and methods are useful for diagnosing or treating an anti-TNF related condition, e.g. cancer, anorexia, cachexia, or an immune, cardiovascular,
